

# Litigation & Dockets — Daily Performance

Run date: 2026-04-16 · Hub session: reporting-hub-performance-2026-04-16T0032 · Tool: litigation

## 1. Health

|                             |                      |
|-----------------------------|----------------------|
| Availability                | operational          |
| Producer lock               | UNLOCKED             |
| SESSION_STATE mtime         | 2026-04-14 17:46:39Z |
| PROGRESS_LOG mtime          | 2026-04-14 17:46:11Z |
| Latest report               | (none)               |
| Latest report mtime         | —                    |
| Active candidates (.md)     | 0                    |
| Signals — total in signals/ | 0                    |
| Signals — mtime < 7d        | 0                    |

## 2. Active candidates (candidates/\*.md)

No candidate .md files at top level of candidates/. Pipeline may be cold or candidates live in subfolders.

## 3. SESSION\_STATE.md (head)

```
# SESSION_STATE — Litigation & Docket Signal System (Tool 3)

> Rewritten every session. Not a log — a snapshot of where things stand RIGHT NOW. History lives in `PROGRESS_LOG.md`.

Last updated: 2026-04-14 (Session 4 — offline script prep; sandbox still down)

---

## TOP HEADLINE

**Phase 2 PARTIAL. `tools/party_resolver.py` is coded end-to-end (Stage 1 + Stage 2 resolution chain) with offline unit tests at `tools/test_party_resolver.py`. Both baseline JSONs (`party_resolution_cache.json`, `exhibit21_subsidary_table.json`) exist as schema-only empty files. NO live validation occurred: the Cowork bash sandbox was unavailable this entire session. PTAB v2 snapshot side-quest was NOT attempted — critical, 5 days left before v2 decommission (2026-04-20). Next session priority: retry sandbox, run offline tests, populate Exhibit-21 table, seed cache with 20 smoke-test cases, pull PTAB v2 snapshot.**

---

## Current Phase

**Build / Phase 2 — PARTIAL (scaffold complete, live population blocked).**
- `tools/party_resolver.py` authored: Stage 1 normalizer (pure function), Stage 2 resolver (5-method fallback chain: cache → EDGAR exact → EDGAR fuzzy → Exhibit-21 → OpenFIGI NAME), HTTP plumbing with SEC fair-access throttle, per-host UA dispatch per D-015, write-through cache gated at confidence ≥0.85 per D-009.
- `tools/test_party_resolver.py` authored: offline unit tests for Stage 1 covering corporate-suffix stripping (English + European forms), stacked suffixes, government/individual classification, Unicode normalization, signal-schema projection, Holdings caveat regression guard. Not yet executed (sandbox outage).
- `baselines/party_resolution_cache.json` scaffolded: schema-version 1 + `_entry_schema` + empty `entries: {}`. 20 hand-validated seed cases pending.
```

- `baselines/exhibit21\_subsidary\_table.json` scaffolded: schema-version 1 + `\_entry\_schema` + `\_known\_caveats` + empty `entries: {}`. Top-100 S&P 500 10-K population pending.
- Stage 2 has been code-reviewed but NOT smoke-tested against live EDGAR or OpenFIGI.

**\*\*Next: Build / Phase 2 – live-data completion.\*\*** Before Phase 3 scanner builds can begin, the following MUST be done (with a working sandbox):

1. Run `tools/test\_party\_resolver.py` – expected green (offline-only).
2. Author and run `tools/build\_exhibit21\_table.py` – populate `exhibit21\_subsidary\_table.json` with top-100 S&P 500 constituent subs (minimum viable floor: top-25).
3. Hand-curate 20 seed cases in `party\_resolution\_cache.json` – S&P 500 majors, wholly-owned subs (Exhibit-21 path), plus individual/government negative coverage.
4. Run Stage 2 end-to-end smoke test; record pass/fail and confidence distribution in a new PROGRESS\_LOG block.
5. Time-critical side-quest: PTAB v2 snapshot pull for `baselines/ptab\_baseline\_proceedings.json` before **\*\*2026-04-20\*\***.

---

#### ## Active Work Units

None. No candidates exist. No scanners built. The pipeline is cold.

---

#### ## Watchlist

Empty. Watchlist populates once Phase 4+ produces convergences that don't clear the 28-point Immediate threshold but score 22-27 (per scoring rubric bands).

---

#### ## Future Pipeline

| Phase | Scope                                                                                           | Gate to start                                                   |
|-------|-------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| ----- | -----                                                                                           | -----                                                           |
| 1     | Endpoint validation                                                                             | ■ COMPLETE 2026-04-14                                           |
| 2     | Party-resolution cache bootstrap                                                                | ■■ PARTIAL 2026-04-14 (code done; live data blocked by sandbox) |
| 3     | Scanner builds – federal_civil + SEC_enforcement first                                          | Phase 2 live-data complete (not yet)                            |
| 4     | Remaining four scanners + convergence engine + scoring (PTAB pending Q-004; Chancery per D-016) | Phase 3 complete                                                |
| 5     | Scheduled-task registration + 7-day autonomous burn-in                                          | Phase 4 complete                                                |
| 6     | Reporting layer                                                                                 | Phase 5 complete                                                |
| 7     | Kill-condition monitor + maintenance audits                                                     | Phase 6 complete                                                |
| 8+    | Non-US, bankruptcy, judge-effect scoring (Q-001)                                                | Post-v1                                                         |

---

#### ## Active Warnings

## 4. PROGRESS\_LOG.md (tail ~80 lines)

#### ### Questions raised

None new. Q-003 (CourtListener rate-limit verdict), Q-004 (PTAB v3 WAF bypass), Q-005 (EDIS spec re-pull) remain open from Session 2.

#### ### Verification steps completed

- Cross-read `party\_resolver.py` resolution chain against CONTEXT.md §"Entity Resolution Protocol" and the confidence

bands in D-003 – every method→confidence pair matches.

- Cross-read Stage 1 suffix regex against the worked examples in CONTEXT.md (`Apple Inc.` → `apple`, `Acme Holdings, Inc.` → `acme`) – matches.
- Confirmed `as\_signal\_raw\_data()` emits exactly the three fields `party\_raw\_name`, `resolution\_method`, `resolution\_confidence` that INSTRUCTIONS.md §3 and the signal schema in CONTEXT.md require inside `raw\_data` (other signal fields are composed by the scanner, not the resolver).
- Confirmed cache write-back is gated at `confidence >= 0.85` (inspected `\_save\_cache` + the call site in `resolve()`), per D-009.
- Confirmed per-host UA dispatch: SEC hosts get `OPERATIONAL\_UA`, OpenFIGI gets `NEUTRAL\_UA`, no SEC UA leaks to OpenFIGI or vice-versa. D-015 compliance verified by code read.
- Verified test file runs without `requests` / `rapidfuzz` imports at the module level – Stage 1 remains testable when those packages are absent (lazy imports inside Stage 2 helpers).
- Verified baseline JSON files parse as valid JSON (schema doc inlined; no trailing commas; `entries: {}` present).

### Artifacts NOT produced (by design or by block)

- `baselines/exhibit21\_subsidary\_table.json` is EMPTY of rows. Target population (top-100 S&P 500 10-Ks via `efts.sec.gov/LATEST/search-index?q="Exhibit+21"&forms=10-K`) requires live HTTP – **blocked** by sandbox unavailability this session\*\* (two workspace-start attempts returned "Workspace unavailable. The isolated Linux environment failed to start").
- `baselines/party\_resolution\_cache.json` is EMPTY of entries. 20 hand-validated seed cases for smoke-test require live EDGAR + OpenFIGI calls – **blocked** by sandbox\*\*.
- `tools/test\_party\_resolver.py` was written but NOT run. Sandbox outage prevents executing it this session. The file itself is structurally clean (stdlib-only, no external deps) and should run green when sandbox returns.
- Stage 2 end-to-end smoke test – **blocked** by sandbox\*\*.
- PTAB v2 snapshot pull for `baselines/ptab\_baseline\_proceedings.json` (Phase 1b side-quest, D-014 clause (d)) – **blocked** by sandbox\*\*. Critical: PTAB v2 dies 2026-04-20 (6 days away). Documented as the top-priority item for next session IF sandbox is back.
- `tools/build\_exhibit21\_table.py` (the population script referenced in the exhibit21 skeleton's `\_population\_status`) – not authored; deferred to next session when live HTTP is available for iterative development.
- Scanner code (`tools/\_scanner.py`) – Phase 3+.

### Sandbox outage – honest accounting

The Cowork bash sandbox was unavailable for the duration of this session. Two attempts to start it returned the same "Workspace unavailable" error. Every file-write action (party\_resolver.py, both baseline JSONs, test\_party\_resolver.py, this log entry) succeeded because they use the Write/Edit file tools, not bash. But every action requiring HTTP (live EDGAR calls to build the Exhibit-21 table, live OpenFIGI calls to smoke-test Stage 2, live USPTO calls to grab a v2 snapshot before decommission) was blocked.

Phase 2 is therefore **PARTIAL, NOT COMPLETE**. The code path is structurally correct and offline-testable, but no live-data validation has occurred. Phase 3 (scanner builds) **MUST NOT** start until:

1. `test\_party\_resolver.py` has been run and passes (offline check).
2. Stage 2 has been smoke-tested against live EDGAR + OpenFIGI for at least the 20 seed cases, with confidence distribution recorded.
3. At least a partial Exhibit-21 table exists (top-25 S&P 500 is the minimum viable floor; top-100 is target).

### Net state

Phase 2 **PARTIAL**. Party resolver coded end-to-end with offline Stage 1 tests; both baseline JSONs exist as empty schemas; no live validation performed due to sandbox outage. PTAB v2 snapshot pull missed this session; next session has 5 days before v2 decommissions. No new D-entries, no new Q-entries. Zero scanners built. Next session = retry Phase 2 live-population (Exhibit-21 build + cache seed + Stage 2 smoke) + PTAB v2 snapshot pull (time-critical) + Q-005 EDIS spec re-pull.

---

## Session 4 – 2026-04-14 – OFFLINE SCRIPT PREP (narrow re-lock)

**\*\*Mode:\*\*** Interactive (Pedro directing), narrow re-lock after Session 3 closed.

**\*\*Scope:\*\*** Author-only, no execution. Front-load the two scripts next session will need to run the moment sandbox returns, to preserve the narrow 5-day window before PTAB v2 decommission. Write scope limited to `tools/`.

### What was done

- Re-probed sandbox (still unavailable – same "Workspace unavailable" error as Session 3).
- Re-locked `SESSION\_LOCK.md` for this narrow scope at 2026-04-14T13:30:00Z.
- Authored `tools/ptab\_v2\_snapshot.py`: one-shot paginated pull of the USPTO Developer Hub

— end of per-tool performance report —
