3. SESSION_STATE.md (head)

SESSION_STATE — Non-US Primary-Source Discovery System (Tool 2)

TOP HEADLINE

Maintenance cycle 2026-04-16T22:46Z: ****clean health pass – all 4 active scanners healthy, signal log clean, OpenFIGI cache 100% hit rate, no candidate drift, no new boilerplate rules****. ASX universe 1 day old (426 tickers). CA universe still missing – SEDAR+ remains blocked. Dependencies reinstalled in sandbox (cold start).

Current phase

****Phase 3 complete (Australia).**** Phase 4 (Canada SEDAR+) code complete, still blocked on `tools/ca\_universe.py` run / `working/ca\_universe.json` file.

Next concrete maintenance action

1. ****Build `working/ca\_universe.json`**** – invoke `python3 -m tools.ca\_universe` (or inspect `tools/ca\_universe.py` for the actual entry point) so SEDAR+ scanner can return non-zero raw signals. This has been the standing #1 next-action for several cycles.
2. ****Patch `tools/tdnet\_scanner.py` thesis_direction classifier**** for buyer-side TOB cases (8001 Itochu defect). Did not re-surface this maintenance cycle.
3. ****Begin Phase 5 (Hong Kong HKEx)**** – scanner module `tools/hkex\_scanner.py` not yet built.

Steady-state confirmations

- ASX chunked scanner stable (6-day universe TTL adequate).
- Novelty dedup compressing fresh-immediate counts to ~0/cycle for all scanners (expected behavior).
- Foreground bash + `timeout 38` + chunked mode is the durable run pattern; nohup still locks the sandbox.
- Reporting Hub remains read-only consumer of this system's state; no writes from Tool 2 to `Reporting Hub/`.

Active candidates (unchanged this cycle)

ID	Score	Status	Notes
WBC_XASX	30.0	candidate	westpac-hy2026-items-impacting-results
PTSB_XLON	33.0	candidate	bawag-recommended-cash-offer
9601_XTKS	31.0	candidate	shochiku-osaka-building-impairment
2972_XTKS	35.0	candidate	sankei-real-estate-tender-offer
6058_XTKS	31.0	candidate	vector-special-losses
CCL_XASX	–	candidate	cuscal-institutional-placement
(+15 prior XTKS candidates)			

4. PROGRESS_LOG.md (tail ~80 lines)

■ Next:

- Unblock and validate end-to-end SEDAR+ run (first XTSE/XTSX candidate).
- Implement holder-size threshold filter in `tools/asx\_scanner.py` at emit time to reduce `substantial\_holder\_change` noise before triage.

■ Blockers:

- None for maintenance. Carrying forward: Phase 4 end-to-end run sandbox blocker (see `PHASE4\_PROGRESS.md`).

2026-04-15 – non-us-maintenance cycle (09:11Z)

■ Completed:

- Cold start: read CLAUDE.md, task SKILL.md, CLAUDE project doc, SESSION_STATE, PROGRESS_LOG.
- SESSION_LOCK: prior operational lock (05:00Z) had TTL-expired at 09:00Z (11 min past); took lock as `non-us-maintenance-2026-04-15T0911`.
- Scanner endpoint probes (all HTTP 200 + expected schema): lse_rns 113KB/0.97s, tdnet 63KB/1.11s, asx 5 data items/0.65s,

sedar 7KB/0.61s. Pending scanners (hkex/kind/bse_nse/cvm/bmv) still module_missing – expected.

- py_compile clean on all active scanner modules + shared utilities.
- Universe freshness: `working/asx\_universe.json` age 0.71 days (426 tickers). Well under 6-day refresh trigger.
- Signal log audit: 101 entries (+11 since last cycle from new lse_rns 2026-04-15 scan). Zero duplicate content-hashes, zero orphan FIGIs, zero missing hashes. By scanner tdnet=15 / lse_rns=27 / asx=59. By routing immediate=11 / watchlist=53 / archive=37.
- Signal log schema confirmed slim-index (no `signal\_type`/`strength\_estimate`) – drift checks use `score\_total>=28` as strong-signal proxy. Prior cycles' reliance on `strength\_estimate` was unreachable from the log alone.
- OpenFIGI cache: 87 files on disk (+8). Sample 20/20 = 100% resolved. Last-scan FIGI resolve: asx 59/59, lse_rns 11/11, tdnet 3/3 → 100% across the board.
- Boilerplate audit (unchanged raw scan; no new ASX scan since 2026-04-14): raw 149 → processed 59.
- `substantial\_holder\_initial` and `substantial\_holder\_ceasing` dropped 100%; `substantial\_holder\_change` survives at 98% (48/49) and still dominates processed volume. Holder-size threshold filter recommendation carried forward (3rd cycle in a row).
- Candidate drift: 5 candidates reviewed against signal_log. All 7 score≥28 matches on tracked issuer_figis reconcile to existing `related\_signal\_ids` – no uncaptured high-strength signals. No markdown updates required.
- Dependencies: yfinance 1.2.2, pandas 2.3.3, requests 2.33.1 importable after `pip install --break-system-packages`.

■ In progress:

- Phase 4 (SEDAR+) end-to-end run still blocked per `PHASE4\_PROGRESS.md`.

■ Next:

- Unblock SEDAR+ end-to-end run; first XTSE/XTSX candidate markdown.
- Implement holder-size threshold filter in `tools/asx\_scanner.py` at emit time.
- Phase 5 prep – HKEx scanner module.

■ Blockers:

- None for maintenance. Carrying forward: Phase 4 end-to-end run blocker.

2026-04-15 – non-us-operational cycle (09:25Z)

■ Completed:

- Cold start: read CLAUDE.md, INSTRUCTIONS.md, SESSION_STATE, PROGRESS_LOG, SESSION_LOCK.
- SESSION_LOCK: acquired at 09:25Z as `non-us-operational-2026-04-15T0925` (prior maintenance session released at 09:14Z).
- Dependencies re-installed via `pip install --break-system-packages`.
- Scanners run (window=7):
- `lse\_rns` → 11 raw / 11 triaged / 11 resolved / 11 watchlist (all score=23.0, no immediates).
- `tdnet` → 27 raw / 27 triaged / 27 resolved / **17 immediate** + 10 watchlist. Major TOB / MBO cluster.
- `asx` → attempted twice at throttle=0.05 and 0.1 with 35s and 40s wall-clock budgets; scanner did not finish within budget. No asx output this cycle. Carried forward.
- `sedar` → no Canada universe file available (same blocker noted in PHASE4_PROGRESS); scan exited cleanly with 0 signals. Carried forward.
- Wrote 13 new candidate markdowns for TDnet immediates:
- Hand-authored: `6197\_XTKS\_solasto-mbo-tender-offer.md`
- Scripted stubs (12): 3391 Tsuruha (TOB), 6027 Bengo4 (impairment), 8267 Aeon (TOB), 1882 Toa Road (litigation), 4206 Aica Kogyo (TOB), 7085 Curves (profit upgrade), 6135 Makino Milling (TOB), 6367 Daikin (litigation), 2692 Itochu-Shokuhin (TOB), 8001 Itochu Corp (TOB), 8934 Sun Frontier (TOB), 2540 Yomeishu (TOB).
- All include frontmatter, source signals, translation notes, thesis, steelman, kill conditions, catalyst map, sizing, traceability per template.
- 2972 Sankei (existing candidate) – 1 additional signal landed; no re-write needed since existing markdown already covers the TOB arc.
- Wrote 21 watchlist JSON entries to `candidates/watchlist/` (11 lse_rns + 10 tdnet).
- `signals/signal\_log.json`: 90 → 128 entries (+38). By routing: immediate 11→28 (+17), watchlist 42→63 (+21), archive 37→37.

■ In progress:

- ASX scan not completed this cycle – needs a wall-clock budget greater than what a single bash call allows, or chunked

universe scan.

- SEDAR+ still blocked on missing Canada universe file.

■ Next session priority (operational + maintenance):

1. **ASX scan wall-clock:** either split ASX universe into 3 chunks of ~140 tickers and run 3 separate pipeline invocations, or add a `--max-tickers N` flag t
