

Investment Signal Tools — Overview

Pedro · 15 April 2026 · Tool & subtool briefing

Four complementary tools that scan underused primary-source data for equity signals before they reach mainstream research. Each tool targets a distinct information silo; within each tool, individual subtools (scanners, channels, or behavioral dimensions) carry their own rationale for why they generate edge. A shared Reporting Hub consumes each tool's output read-only and produces consolidated performance reports and deep-dive theses.

Tool 1 — Investment Discovery System (US)

What it does

Autonomous scanner that surfaces non-traditional investment ideas in US-listed equities by combining obscure public signals that individually look like noise but converge into high-conviction candidates. Runs hourly, keeps active candidates under deep-dive monitoring until their catalyst resolves, and promotes only those scoring 28 or higher after a false-positive kill-sweep.

Data leveraged

SEC EDGAR filings, FDA PDUFA calendar, congressional trading via Capitol Trades, federal contract awards via USAspending, ESMA short-seller position registers, insider transaction cadence, and analyst-revision flow — cross-validated against yfinance pricing.

Edge · asymmetric information

Cross-silo convergence. A generalist would need six feeds to spot that the same name is simultaneously showing distress language, short build-up, insider accumulation, and a pending FDA date; the tool fires only when weak signals corroborate each other.

Scanners and rationale

- **EDGAR Keyword Scanner** — catches material-event language (going concern, restructuring, impairment) buried in 8-K and 10-K filings before consensus prices the risk.
- **ESMA Short-Position Aggregator** — aggregates FCA, AMF, AFM and BaFin short disclosures to reveal coordinated institutional shorting that US-only data misses.
- **Congressional Trading Monitor** — reads disclosed trades by members of Congress and family, capturing legislative intelligence that tends to precede policy and regulatory moves.
- **Contract Award Monitor** — tracks USAspending wins and losses to flag government-revenue cliff risks before company guidance acknowledges them.
- **FDA PDUFA Calendar** — anchors each biotech candidate to an exact approval date, so silence or an unexplained delay surfaces pre-announcement regulatory friction.
- **Insider Transaction Cadence** — monitors Form 4 velocity; clusters of insider buys on weakness, or sudden halts, front-run disclosure.
- **Convergence Engine** — the core of the edge — requires multiple independent signals on the same ticker within a 30-day window before promoting to candidate.

Tool 2 — Non-US Discovery System

What it does

Parallel scanner to Tool 1 aimed entirely at non-US primary-source portals. Reads the filings exchanges publish directly — not English-language news wires — and converts them into the same candidate format used for US names.

Data leveraged

Nine non-US disclosure portals covering Europe, Asia-Pacific, and Latin America. Currently operational on ASX and TDnet; other feeds are instrumented and pending universe-file population.

Edge · asymmetric information

Non-US disclosures are structurally invisible to US retail and most US sell-side research because of language, time-zone lag, and format fragmentation. Every candidate this tool produces is, by construction, one Tool 1 cannot see.

Per-exchange scanners

- **LSE RNS** — UK Regulatory News Service filings expose material UK and European corporate events hours before cross-listing news reaches the US tape.
- **TDnet (Japan)** — Timely Disclosure Network captures Japanese tanshin filings — tender offers, impairments, and M&A — before English translations surface.
- **ASX (Australia)** — Announcements expose junior miner drilling results and biotech capital decisions that rarely reach US analyst consensus.
- **SEDAR+ (Canada)** — Consolidated TSX and TSXV filings surface junior commodity, mining, and energy financing pivots that US-centric research ignores.
- **HKEx (Hong Kong)** — Filings from mainland Chinese issuers capture supply-chain, regulatory, and capital-control developments that precede ADR repricing.
- **KIND (South Korea)** — Filings from Samsung, Hyundai, SK Hynix and peers expose semiconductor capacity shifts and earnings warnings before global consensus moves.
- **BSE / NSE (India)** — Indian exchange filings from IT services and pharma names flag margin warnings and client losses before US earnings revisions.
- **CVM (Brazil)** — Commodity and energy issuers' disclosures expose production cuts and debt-covenant risks before global price consensus resets.
- **BMV (Mexico)** — Manufacturing and consumer issuers disclose tariff impacts and capex freezes before they propagate into US supply-chain repricing.

Tool 3 — Litigation & Docket Signal System

What it does

Scanner for US legal-docket channels that move equities before any company press release. Resolves legal party names to public-company FIGIs through a two-stage EDGAR plus OpenFIGI matching protocol, then triages, scores, and promotes candidates into dedicated litigation briefs.

Data leveraged

CourtListener RECAP, USITC and EDIS, USPTO PTAB, Delaware Chancery Court, SEC enforcement releases, and DOJ/FTC antitrust announcements. Entity resolution uses EDGAR Exhibit-21 tables and OpenFIGI fuzzy matching.

Edge · asymmetric information

Pure timing. Litigation signals are recorded in public dockets weeks or months before the company party to them discloses anything. Most institutional desks react to the 8-K; this tool reacts to the court filing that forced it.

Channels and rationale

- **Federal Civil (PACER / CourtListener)** — product liability, patent, and class-action dockets flag product risk and contingent liabilities well before restatement or settlement disclosure.
- **ITC Section 337** — trade-barrier and forced-licensing outcomes reshape export and margin assumptions before they are reflected in sell-side models.
- **PTAB IPR (USPTO)** — inter-partes review outcomes expose core-patent invalidation risk for pharma and biotech before license renegotiations are disclosed.
- **Delaware Chancery** — M&A breakup litigation, derivative actions, and management contests surface weeks before any formal announcement or defensive guidance.
- **SEC Enforcement** — SEC litigation releases and subpoena-triggered 8-Ks expose FCPA, fraud, and disclosure investigations ahead of settlement date.
- **DOJ / FTC Antitrust** — antitrust challenge filings and merger-review delays front-run forced divestitures and remedial liabilities before deal terms are revised.

Tool 4 — Silence Tool (pre-launch)

What it does

Inverts the paradigm of the other three tools. Instead of scanning for filed events, it builds a behavioral baseline for every US-listed issuer and emits a probabilistic signal when an issuer's activity drops significantly below its own historical norm. Currently in specification phase; instantiation begins with a 90-day baseline warm-up per issuer.

Data leveraged

EDGAR filing timestamps, press-release feeds, news and social mention volume, earnings-call transcripts, insider-trading cadence, and sell-side analyst note distribution. Outputs are z-scores and p-values against each issuer's own prior.

Edge · asymmetric information

The silence before a board transition, an internal investigation, an M&A dark period, or a restatement review is a real statistical object. None of the other tools capture this: they wait for something to happen; this one fires when the issuer stops happening.

Behavioral dimensions

- **EDGAR Filing Cadence** — multi-week suppression of 8-K relative to baseline signals a pre-announcement review period or a regulatory inquiry forcing disclosure hold.
- **Press-Release Cadence** — sudden halt in Business Wire and PR Newswire output from a 6-to-10-release-per-month issuer often precedes M&A talks or executive transition.
- **Insider Transaction Cadence** — abrupt stops in Form 4 activity and 10b5-1 plan suspensions indicate blackout periods triggered by undisclosed material information.
- **News and Social Mention Volume** — sharp drops in GDELT, Reddit, and StockTwits mentions reflect either a communications halt or reduced journalist access — both are early tells.
- **Conference and Investor-Event Presence** — absence from historically-attended sell-side conferences like JPM Healthcare or Goldman Communacopia often precedes guidance risk announcements.
- **Analyst-Note Cadence** — a drop in rating-change and target-price revision frequency reflects issuer silence on guidance, which frequently precedes earnings surprises.

Taken together, the four tools cover four orthogonal sources of alpha: cross-silo convergence in US filings (Tool 1), geographic and linguistic arbitrage (Tool 2), legal lead-time (Tool 3), and behavioral anomaly detection (Tool 4). Within each tool, the subtools decompose the underlying edge into a set of independent, testable signals.
